Appendices

1. INTRODUCTION

In accordance with our instructions, this Geotechnical Completion Report has been prepared for WFH Properties Ltd as part of the documentation to be submitted to Auckland Council following earthworks to form the development. Construction of this residential subdivision has been undertaken in accordance with the Auckland Council Resource Consent number SUB60361402/LUC60361401 and Engineering Approval letter ENG60371708 dated 2 June 2021. A timber pole retaining wall was also constructed during the civil works.

This report contains our Suitability Statement (presented in ***Appendix A***), specific comments related to items raised in the Resource Consent, relevant test data and Woods as-built plan set as provided in ***Appendix B***.

This report covers the construction period January 2021 to October 2021 and is intended to be used for certification purposes for new lots (listed below) created from Lot 1 DP 445482 and Lot 3 DP 168595 as follows:

- 38 new residential lots numbered 1 to 38;
- 3 new roads named as follows;
    - Butler Stoney Crescent;
    - Memory Place;
    - Botanical Drive.

The Bartlett Block development is located off Bankside Road in Silverdale. As can be seen from the as-built plans, 22 of the lots have been affected by filling as part of the earthworks operations to a maximum depth of approximately 4 metres.

2. PROJECT BACKGROUND

The geotechnical investigations and design were undertaken by CMW as presented in the following reports:

- CMW Geosciences, Geotechnical Investigation Report referenced AKL2020-0082AB Rev. 1 dated 5 August 2020;
- CMW Geosciences, Settlement Monitoring Plan referenced AKL2020-0082AD Rev. 0 dated 9 December 2020;
- CMW Geosciences, Retaining Wall Design Report referenced AKL2020-0082AG Rev. 0 dated 27 April 2021.

3. DESCRIPTION OF EARTHWORKS

JG Civil Limited commenced work across the development in late-January 2021, with the removal of topsoil from the gully area, mucking out of the gully base and installation of the underfill gully drain. This coincided with the installation of a sediment control pond within the Metro Park West Reserve and the establishment of the site office adjacent to Bankside Road. A settlement monitoring plate was installed within the base of the gully to facilitate settlement monitoring throughout the filling operations.

Various topsoil stripping operations continued in late January, with Radich Contractors mobilised on site to begin the bulk cut to fill operations.

Cut to fill operations continued through February, along with the construction of an additional sediment control pond within the northern portion of the site. Stockpiling of surplus cut and topsoil was conducted along the Metro Park West Reserve area throughout February and into March.

By the end of March, the majority of bulk cut to fill had been completed with the trimming of roads to design subgrade levels commencing.

At the start of April, crews were mobilised on site to begin civil works for the development, which continued through April and into May. Lots within the central portion of the site which had been earthworked to design subgrade underwent topsoiling during the month of April.

By May, roading aggregates had been laid, with civil subcontractors continuing service installation across the development. Various topsoiling works progressed. Road kerbing works commenced and were undertaken through May while existing services at the northern end of site were exposed to facilitate the installation of new services to the development.

Kerbing works progressed into June, along with various civil works and the backfilling of service trenches where service installation had been completed. By late June, JG Civil began filling works along the strip within the Metro Park West Reserve area.

Filling of the Reserve area continued into July, where the decommissioning of the northern sediment pond was also undertaken. By late July, Ruiterman Contracting were mobilised on site to begin the construction of the retaining wall within the north-western portion of the site. As part of the closing civil works, contractors began excavation of the common service trench adjacent to Bankside Road, with service installation following.

By the start of August, the construction of the retaining wall was complete. Hiway Stabilizers arrived on site to undertake lime stabilisation for the remaining filling, which was to be placed within the Reserve, the northern lots and behind the retaining wall. Minor topsoiling works across the site were ongoing.

By mid-August, the majority of the pavement and kerbing works had been completed. Tree planting and the construction of the speed table within the development commenced.

No earthworks or civil works were undertaken during late August and the majority of September 2021 due to government-enforced COVID-19 restrictions.

On returning to site in late September, various completion works re-commenced, including tree planting, the construction of kerbs and footpaths, speed tables and minor topsoiling and filling works.

The remainder of the subdivision works including road sealing and streetlight installation were completed by late-October.

The main items of plant used by the contractor, JG Civil Limited, included:

- 3 x 20T Excavators;
- 3 x 13T Excavators;
- 2 x 5T Excavators;
- 1 x 2.2T Excavator;
- 1 x 1.8T Excavator;
- 2 x Motorscrapers;
- 1 x CAT 815 4-wheel Compactor;
- 1 x Padfoot Compactor;
- 1 x Smooth Drum Roller;
- 1 x Water Cart;
- 2 x Graders.

4. GEOTECHNICAL QUALITY CONTROL

4.1. Site Observations

During the earthworks, site visits were typically undertaken several times each week to assess compliance with NZS 4431 and specific design recommendations and specifications.

Site visits were carried out to observe and confirm compliance relating to:

- Adequate topsoil stripping;
- Fill areas prior to the placement of fill materials to ascertain that all mullock, and soft inorganic subsoils had been removed;
- Installation of underfill drains but excluding road under-channel drains;
- Backfilling of underfill drains;
- Excavation and backfilling of sewer and stormwater trenches. Stormwater and wastewater lines where constructed beneath the roads were backfilled using compacted aggregate. Compaction testing was not requested or completed;
- Underfill drain connections to outlets;
- Construction of a timber pole retaining wall including ground conditions, pile size, spacing and depth; and
- Placement and compaction of engineered fills.

4.2. Compaction Control

Compaction of engineered earth fills was controlled by undrained shear strength measured by handheld shear vane calibrated using the NZGS 2001 method and by air voids as defined by NZS4402.

General Fills

The criteria for undrained shear strength were a minimum single value of 110 kPa and minimum average of any 10 consecutive tests of 140 kPa.

The criteria for air voids were a maximum single value of 12% and maximum average of any 10 consecutive tests of 10%.

Vane shear strength, water content and in situ density tests were carried out on all areas of the engineered filling to at least the frequency recommended by NZS 4431 and/or required by the project specification.

These tests showed on occasions that the contractor was struggling to achieve the required compaction standards with the prevailing site and soil conditions, but to the best of our knowledge, all areas of fill were re-worked as necessary. Subsequent testing confirmed compliance with the specification.

Metro Park West Reserve Filling

A reduced strength criterion was adopted for the filling works conducted within the Metro Park West Reserve. The filling was required to achieve a minimum undrained shear strength of 100kPa.

Uncontrolled Filling

There may be shallow, uncompacted fills in isolated areas outside of lot boundaries where minor re-shaping of the contour occurred near the extent of the earthworks. These fills were not tested and the extent of any such fills or any (undiscovered) fills that existed in these areas prior to the works are not depicted on the as-built plans.

5. EVALUATION OF COMPLETED EARTHWORKS

5.1. Natural Hazards

The appended as-built drawings depict the extents of a series of zones that contain limitations intended to ensure that future building and/ or earthworks on the lots is undertaken in a manner that does not lead to buildings being subject to any of the natural hazards described in Section 71(3) of the Building Act, i.e. erosion, falling debris, subsidence, slippage, and inundation. Consideration of the inundation hazard was outside the scope of CMW's brief and has been assessed by others.

The single applied zone comprises **Specific Design Zone (Retaining)**, which is intended to protect the retaining wall from overloading that could lead to instability.

A full description of the restrictions associated with this zone is presented in the Suitability Statement (***Appendix A***). Additional information is also provided in some of the following sections.

5.2. Land Stability and Erosion Control

Slope gradients for the finished development are relatively gentle and do not exceed a nominal gradient of 1V:6H. We are therefore satisfied that these areas are not subject to the natural stability hazards described in the Building Act.

On all steep land, including on engineered batter slopes, surface stability can be compromised by indiscriminate disposal of stormwater onto the ground surface and/ or by removal of vegetation.

Building and landscape designers must ensure that all runoff from solid surfaces is directed into the stormwater system. It is also important that care is paid to the disposal of stormwater during construction so that concentrated discharges (e.g. from unconnected spouting) are not directed towards steep ground.

Depths of mulch and topsoil applied to steep sloping areas should be limited to less than 150mm to minimise the risks of saturation leading to localised slumping on batter face. Wherever practical on such land, and particularly on steep batters, existing vegetation and grass cover should be well maintained. Any vegetation cleared beyond the immediate area of building platforms for temporary construction purposes should be replanted or replaced as soon as possible. The roots of an established vegetation cover can serve to bind the surface soils while the foliage can reduce rain infiltration and soil saturation, resulting in better resistance to erosion and shallow slumping.

5.3. Retaining Wall

A cantilever timber pole retaining wall has been constructed in the location shown on the appended Woods As-built Plan referenced 37050-1300-AB Rev.1. The timber pole retaining wall is located within Lots 17, 18 and 20. This wall reaches a maximum height of approximately 0.9 metres and was designed by CMW Geosciences who also observed the construction of the wall. A copy of the Producer Statement - Construction Review is provided in ***Appendix E***.

Descriptions of the building and earthworks restrictions within the vicinity of these walls (Specific Design Zone – retaining) are contained in the Suitability Statement in ***Appendix A*** and shown on the appended Woods Retaining Wall Asbuilt Plan referenced 37050-1301-AB Rev. 2. Lots containing this zone include Lots 17, 18 and 20.

5.4. Fill Induced Settlement

The majority of the filling on this stage of the development was placed prior to late-March 2021. A settlement marker was installed within the deepest area of fill prior to the commencement of filling and was periodically monitored for vertical movements. As shown on the settlement monitoring results presented in ***Appendix F***, a maximum settlement of 63mm was recorded. Settlement monitoring was then ceased once it was

assessed to have reached t_{90}, with final readings only depicting vertical movements which were typical of seasonal shrink/swell variations.

On the basis of the results, we are satisfied that t_{90} primary consolidation settlement has been achieved here and that fill-induced settlement does not pose a hazard to NZS 3604 type building development.

5.5. Service Line Trenches

As part of the civil works, sanitary sewer and stormwater services were trenched throughout the development as shown on the appended Woods Stormwater and Wastewater As-built Plans.

As is normal on all subdivisions, building developments involving foundations within a 45-degree zone of influence from pipe inverts will require engineering input. The Auckland Council drawing referenced SW22 provided in ***Appendix B*** extracted from Chapter 4 of the Auckland Council Code of Practice for Land development and Subdivision depicts their requirements for stormwater pipes. Details for water and wastewater pipes are available in the Watercare COP1 - General Requirements and Procedures. The resulting restrictions are presented in the Suitability Statement below.

5.6. Underfill Drains

The appended Woods as-built plan referenced 37050-1200-AB Rev. 1 shows the position of the underfill drain which was constructed in the natural ground during the earthwork's operations prior to the filling of the gully feature. The drain was installed to help control groundwater levels and is linked to the reticulated storm water system.

The trench excavation ranged between 1 and 2 metres deep in the natural ground beneath the filling. Accordingly, it is considered to be beyond the depths of anticipated foundations.

Descriptions of restrictions associated with this drain are contained in the appended Suitability Statement.

5.7. Road Subgrades

Penetration resistance testing was carried out on the road subgrades during construction and the results of this testing were forwarded to Woods for pavement / remedial design. Where soft ground with low equivalent CBR values was identified it was generally undercut and replaced with lime stabilised fill. All road subgrade areas were subsequently lime stabilised to achieve appropriate CBR values.

5.8. Design of Shallow Foundations

5.8.1. Bearing Capacity

Once bulk earthworks and topsoiling of the building platforms had been completed, our staff drilled hand auger boreholes on platforms in natural ground to determine representative finished ground conditions and hence evaluate likely foundation options for future building development. Our assessments of bearing capacity for the design of shallow foundations on each building platform are contained in the appended Suitability Statement.

At current subgrade levels, Lots 1 to 38 inclusive have been assessed as having a geotechnical ultimate bearing capacity of 300 kPa within the influence of conventional shallow residential building foundation loads.

If higher geotechnical ultimate bearing capacities are required, further specific site investigation and design of foundations should be carried out prior to Building Consent application.

5.8.2. Foundation Settlements

At the bearing pressures specified above and subject to the design requirements for soil expansiveness provided below, differential settlement of shallow foundations for buildings designed in accordance with NZS 3604 (including the 600mm subfloor fill depth limit) should be within code limits.

5.8.3. Soil Expansiveness Classification

Seasonal shrinking and swelling results in vertical surface ground movement which can cause significant cracking of floor slabs and walls. NZS 3604:2011[1] excludes from the definition of 'good ground', soils with a liquid limit of more than 50% and a linear shrinkage of more than 15% due to their potential to shrink and swell as a result of seasonal fluctuations in water content. For soils exceeding these limits, NZS 3604 has historically referenced AS 2870[2]. for foundation design advice. However, the November 2019 update of Acceptable Solution B1/AS1[3] provides amendments to NZS 3604 that define a method for testing and classifying the soils and provides foundation designs for specific, simple house configurations across the range of expansive soil conditions.

Nevertheless, there is evidence[4] indicating that the use of the B1/AS1 method of assessment of expansiveness may be inaccurate.

Seven sets of soil tests were carried out on samples taken from the likely foundation level on lots within the development. Testing was carried out in accordance with NZS 4402, "Methods of Testing Soils for Civil Engineering Purposes" test 2.2 and 2.6 and were used in conjunction with visual-tactile assessment of the site soils and BRANZ Report SR120A[5] to determine expansive site Classes as defined in AS 2870, "Residential Slabs and Footings – Construction". All test results are appended.

The expansive soil hazard is addressed by a combination of appropriate foundation design, careful site preparation and diligent maintenance of plantings near the foundations.

Foundation Design

We have assessed the AS 2870 Site Classes for the development as follows:

- H1 (high): Lots 1 to 13, 18, 20 and 27 to 33 inclusive;
- H2 (high): Lots 14 to 17, 19, 21 to 26 and 34 to 38 inclusive.

Details of foundations options for these Classes are contained in the appended Suitability Statement.

Site Preparation

There have been instances of concrete floors and/ or foundations that have been poured on dry, desiccated subgrades in summer months on expansive soils and have undergone heaving and cracking requiring extensive repairs or re-building once the soil moisture contents have returned to higher levels. In some instances, perimeter foundations have been appropriately treated but floor slabs have been poured on dry ground. Infiltration of moisture via pipe bedding has then occurred.

Foundation contractors need to be made aware of the extreme damage potentially caused by these circumstances and the need to maintain appropriate moisture contents in the footings and building platform subgrade between the time of excavation and the pouring of concrete.

[5] Fraser Thomas Limited (2008) - Addendum Study Report (BRANZ SR120A), Soil Expansivity in the Auckland Region – Final Report

Remedial actions that may be appropriate include platform protection with a hard fill layer, pouring of a blinding layer of concrete in footing bases and soaking of the building platform with sprinklers for an extended period.

Site Maintenance

Landowners must be mindful that either the planting or removal of high-water demand plants where their roots may extend close to footings (i.e. within a lateral distance of 1.5 times the mature tree height) can cause settlement or heave damage.

5.9. Topsoil Depths

Topsoil depths have been checked by the drilling of a borehole in the approximate centre of the building platform on each lot. The results are considered indicative for each lot but may be subject to variations. Topsoil depths are between 50mm and 300mm within the development.

Site specific findings are contained in the appended Suitability Statement Summary (***Appendix A***). However, it is possible that further levelling works have been undertaken since our investigations and accordingly, we strongly recommend that lot purchasers complete their own checks of topsoil depths.

6. CLOSURE

The appended Statement of Professional Opinion is provided to Auckland Council and WFH Properties Ltd for their purposes alone on the express condition that it will not be relied upon by any other person. It is important that prospective purchasers satisfy themselves as to any specific conditions pertaining to their particular land interest.

Although regular site visits have been undertaken for observation, for providing guidance and instruction and for testing purposes, the geotechnical services scope did not include full time site presence. To this end, our appended Suitability Statement also relies on the Contractors' work practices and assumes that when we have not been present to observe the work, it has been completed to high standards and in accordance with the drawings, instructions and consent conditions provided to them.

Similarly, it assumes that all as-built information and other details provided to the Client and/ or CMW by other members of the project team are accurate and correct in all respects.

Appendix A: Statement of Professional Opinion as to the Suitability of Land for Building Development

STATEMENT OF PROFESSIONAL OPINION AS TO THE SUITABILITY OF LAND FOR BUILDING DEVELOPMENT

I, Andrew Linton, of CMW Geosciences (NZ) Limited Partnership, Auckland, hereby confirm that:

1. As a Chartered Professional Engineer experienced in the field of geotechnical engineering, I am a Geo-professional as defined in Section 1.2.2 of NZS 4404 and was retained by the Developer as the Geotechnical Engineer on the Bartlett Block Residential Development.

2. The extent of preliminary investigations carried out to date are described in the CMW Geosciences Geotechnical Investigation Report referenced AKL2020-0082AB Rev. 1 dated 5 August 2020. The conclusions and recommendations of those documents have been re-evaluated in the preparation of this report. The results of all tests carried out are also appended.

3. In my professional opinion, not to be construed as a guarantee, I consider that:

   (a) The earth fills shown within the limits of the development on the appended Woods As-built Plans referenced 37050-1100-AB Rev. 1 to 37050-1102-AB Rev.2 have been placed in compliance with NZS 4431, the Auckland Council Unitary Plan and related documents. Earth fills shown within the Metro Park West Reserve have been placed in accordance with the specifications in our Geotechnical Completion Report.

   (b) **Specific Design Zone (Retaining) areas** have been applied on Lots 17, 18 and 20 inclusive for the protection of the function of the retaining walls. The retaining walls on this stage of the development were designed for a maximum of 12 kPa surcharge load and 0° toe slope. No building construction and no earthworks (i.e. cut or fills) should take place that exceed these design limits on the walls unless endorsed by a Chartered Professional Engineer experienced in geomechanics and familiar with the contents of this report who consider the stability implications of the earthworks and/ or building proposals on the retaining walls. The extents of the Specific Design Zone (Retaining) is shown on the appended Woods retaining Wall As-Built plan referenced 37050-1301-AB Rev. 2.

   (c) The function of the subsoil drains installed beneath Lots 10, 11, 27, 28 and 32 must not be impaired by any building development or landscaping works. Any bored or driven piles must be positioned to avoid damaging the draincoils. Where any subsoil drain is intercepted by building works, it must be reinstated under the direction of a Chartered Professional Engineer to ensure the integrity of the subsoil drainage system.

   (d) A geotechnical ultimate bearing capacity of 300 kPa may be assumed for shallow foundation design on the building platforms of Lots 1 to 38 inclusive.

   If for any reason higher geotechnical bearing capacities are required, further specific site investigation and design of foundations should be carried out prior to Building Consent application.

   (e) The expansive site Class for Lots 1 to 13, 18, 20 and 27 to 33 inclusive has been assessed as AS2870 Class H1 (high) and Lots 14 to 17, 19, 21 to 26 and 34 to 38 inclusive has been assessed as H2 (high). We recommend that building designers note on the Building Consent drawings the need to maintain appropriate moisture levels across building subgrades and in footing excavations (as described in Section 5.8.3 of the Geotechnical Completion Report) for reference by foundation contractors.

(f) The backfilling and compaction of the storm water and sanitary sewer trenches on this subdivision has been carried out to appropriate standards having regard for the prevailing ground conditions and associated compaction induced pipe loadings.

However, no building development should take place within the 45-degree zone of influence of drain inverts unless endorsed by specific design and by construction inspections undertaken by a Chartered Professional Engineer experienced in geomechanics to ensure that lateral stability and differential settlement issues are addressed and that building loads are transferred beyond the influence of the pipe and trench backfill. A copy of drawing SW22 extracted from Chapter 4 of the Auckland Council Code of Practice for Land development and Subdivision this document is provided in Appendix B for clarification. Details for water and wastewater pipes are available in the Watercare COP1 - General Requirements and Procedures.

(g) Subject to the geotechnical limitations, restrictions and recommendations contained in clauses 3(b), 3(c), 3(d), 3(e) and 3(f) above:

(i) The filled and natural ground is generally suitable for residential buildings constructed in accordance with NZS 3604 and the requirements of AS2870 for the appropriate expansive soil class.

(ii) Where shallow foundations are appropriate, design may be carried out in accordance with AS 2870 (Class H1 or H2) or alternately, a specific foundation and structural design may be undertaken by a Chartered Professional Engineer.

4. Road subgrades have been formed with appropriate regard for slope stability and settlement risks.

The following table summarises the conditions on each of the residential lots.

For and on behalf of CMW Geosciences

Andrew Linton

NOTES

1. ALL WORK AND MATERIALS COMPLIES WITH AC STANDARD FOR ENGINEERING DESIGN AND CONSTRUCTION.
2. PIPE BEDDING COMPLIES WITH AC STD DETAIL DRAWING 18000 SHEET 4.4 UNLESS OTHERWISE NOTED.
3. WATERMAINS ARE AN AVERAGE 0.6m BELOW GROUND IN BERMS AND 0.9m BELOW GROUND UNDER ROADS. HARDFILL BACKFILLED BENEATH ROAD CROSSINGS.
4. PIPE SIZES SHOWN ARE EXTERNAL DIAMETER.
5. LOT BOUNDARIES ARE SUBJECT TO FINAL SURVEY.
6. ASBUILT DATA HAS BEEN SOURCED FROM A COMBINATION OF WOODS SURVEY MEASURED DATA AND CONTRACTOR RECEIVED DATA.
7. LOT CONNECTIONS ARE 25MM DIAMETER PIPES UNLESS SHOWN OTHERWISE

NOTES

1. ALL WORK AND MATERIALS TO COMPLY WITH AUCKLAND TRANSPORT STANDARDS. ANY AMBIGUITY BETWEEN DRAWINGS AND COUNCIL STANDARDS TO BE REPORTED TO THE ENGINEER FOR CLARIFICATION.
2. FOOTPATHS TO BE CONSTRUCTED AS PER DETAILS ON TYPICAL CROSS SECTION DRAWINGS.
3. ALL SERVICE DUCTS TO BE POSITIONED USING RELEVANT SERVICE AUTHORITY DRAWINGS
4. PRAM CROSSINGS AND VEHICLE CROSSING ARE TO BE CONSTRUCTED AS PER AUCKLAND TRANSPORT CODE OF PRACTICE.

Attention: Michael Bates

Dear Michael

RE: CONSTRUCTION REVIEW OF A TIMBER POLE RETAINING WALL – BCO10328830
BARTLETT BLOCK, 25 BANKSIDE ROAD, SILVERDALE

CMW Geosciences (CMW) visited the site at Bartlett Block, 25 Bankside Road, Silverdale, legally described as Lot 3 DP168595 on several occasions between July 2021 and August 2021 to observe the site works for the construction of a <1m high timber pole retaining wall along the northern western site boundary.

Our work has included review of the following documents and drawings:

- Conditions of Auckland Council Building Consent referenced BCO10328830, issued 18 June 2021;
- Consented Retaining Wall construction drawings, prepared by CMW Geosciences, referenced AKL2020-0082AG DG01 through to DG03 Rev. 0 dated 22 April 2021;
- Retaining Wall design report for Bartlett Block, Silverdale prepared by CMW Geosciences, referenced AKL2020-0082AG Rev. 1 dated 27 April 2021.

The site works observed and/or tested by CMW staff incorporated:

- Pile hole depth, size and spacing;
- Timber pole size, treatment and pole placement;
- Drainage materials and installation;
- Lagging construction.

Ground conditions within the timber pole pile holes ranged from stiff to very stiff residual soils, with vane shear strengths in the bases and sides of the pile holes ranging between 89kPa and 166kPa. Four piles demonstrated undrained shear strengths within the base of the holes which were below the required design specification of 100kPa. Retaining wall analysis was re-run by CMW to represent actual site conditions, which showed that this section of retaining wall is able to resist the respective design loading even with a reduced foundation soil strength. No groundwater was encountered in any of the pile holes.

On the basis of our observations and testing, we consider that the site works observed and/ or tested have been completed in accordance with the approved Building Consent and related approved documentation described above, are in accordance with the requirements and/or recommendations of the geotechnical report and provide the basis for our attached PS4 Construction Review Producer Statement.

CMW's site presence during construction for this project included periodic observations of specific elements of work as described herein. As we were not on site at all times during construction, we have relied on the Contractor's attached PS3 certification, diligence and their construction observations to ensure that the works have been carried out in accordance with:

a) The approved Contract drawings and design details.

b) The approved Contract specifications.

c) Authorised Variations to (a) and (b) during the execution of the works.

d) The conditions of Resource and Building Consents where applicable.

e) The relevant Geotechnical Investigation reports, recommendations, and site instructions.

and that all as-built information and other details provided to the Client and/or CMW are accurate and correct in all respects.

For and on behalf of CMW Geosciences

Richard Knowles
Principal Geotechnical Engineer CPEng

Building Code Clause(s) B1

PRODUCER STATEMENT – PS4 – CONSTRUCTION REVIEW

ISSUED BY: CMW Geosciences (NZ) Limited Partnership
(Construction Review Firm)

TO: WFH Properties Ltd
(Owner/Developer)

TO BE SUPPLIED TO: Auckland Council
(Building Consent Authority)

IN RESPECT OF: Construction of a Timber Pole Retaining Wall
(Description of Building Work)

AT: Bartlett Block, 25 Bankside Road, Silverdale
(Address)

Town/City: Auckland **LOT** 3 **DP** 168595 **SO**
(Address)

We CMW Geosciences (NZ) Limited Partnership have been engaged by WFH Properties Ltd
(Construction Review Firm)

To provide ☐ CM1 ☐ CM2 ☐ CM3 ☐ CM4 ☐ CM5 (Engineering Categories) or ■ observation as per agreement with owner/developer. WFH Properties Ltd

or ■ other as described in CMW letter referenced AKL2020-0082AI Rev. 0, dated 12 October 2021 services
(Extent of Engagement)

in respect of clause(s) B1 of the Building Code for the building work described in documents relating to Building Consent No. BCO10328830 and those relating to Building Consent Amendment(s) Nos. N/A issued during the course of the works. We have sighted these Building Consents and the conditions of attached to them.

Authorised instructions/variations(s) No. N/A (copies attached) or by the attached Schedule ☐ have been issued during the course of the works.

On the basis of ■ this review ☐ these review(s) and information supplied by the contractor during the course of the works and **on behalf of the firm** undertaking this Construction Review, **I believe on reasonable grounds** that ■ All or ☐ Part only of the building works have been completed in accordance with the relevant requirements of the Building Consent and Building Consent Amendments identified above, with respect to Clause(s) ..... of the Building Code. I also believe on reasonable grounds that the persons who have undertaken this construction review have the necessary competency to do so.

I, Richard Knowles (AC Author #2342) am: ■ CPEng.# 160049
(Name of Construction Review Professional)

I am a member of: ■ Engineering New Zealand and hold the following qualifications BE (Civil), CMEngNZ, CPEng

The Construction Review Firm issuing this statement holds a current policy of Professional Indemnity Insurance no less than $200,000*.

The Construction Review Firm is a member of ACE New Zealand: ☐

SIGNED BY Richard Knowles (AC Author #2342) (Signature)
(Name of Construction Review Professional)

ON BEHALF OF CMW Geosciences (NZ) Limited Partnership Date 12/10/21
(Construction Review Firm)

Note: This statement shall only be relied upon by the Building Consent Authority named above. Liability under this statement accrues to the Design Firm only. The total maximum amount of damages payable arising from this statement and all other statements provided to the Building Consent Authority in relation to this building work, whether in contract, tort or otherwise (including negligence), is limited to the sum of $200,000.*

This form is to accompany **Forms 6 or 8 of the Building (Form) Regulations 2004** for the issue of a Code Compliance Certificate.

GUIDANCE ON USE OF PRODUCER STATEMENTS

Producer statements were first introduced with the Building Act 1991. The producer statements were developed by a combined task committee consisting of members of the New Zealand Institute of Architects, Institution of Professional engineers New Zealand (now Engineering New Zealand), ACE New Zealand in consultation with the Building Officials Institute of New Zealand. The original suit of producer statements has been revised at the date of this form as a result of enactment of the Building Act (2004) by these organisations to ensure standard use within the industry.

The producer statement system is intended to provide Building Consent Authorities (BCAs) with reasonable grounds for the issue of a Building Consent or a Code Compliance Certificate, without having to duplicate design or construction checking undertaken by others.

PS1 Design Intended for use by a suitably qualified independent design professional in circumstances where the BCA accepts a producer statement for establishing reasonable grounds to issue a Building Consent;

PS2 Design Review Intended for use by a suitably qualified independent design professional where the BCA accepts an independent design professional's review as the basis for establishing reasonable grounds to issue a Building Consent;

PS3 Construction Forms commonly used as a certificate of completion of building work are Schedule 6 of NZS 3910:2013 or Schedules E1/E2 of NZIA's SCC 2011[2]

PS4 Construction Review Intended for use by a suitably qualified independent design professional who undertakes construction monitoring of the building works where the BCA requests a producer statement prior to issuing a Code Compliance Certificate.

This must be accompanied by a statement of completion of building work (Schedule 6).

The following guidelines are provided by ACE New Zealand and Engineering New Zealand to interpret the Producer Statement.

Competence of Design Professional

This statement is made by a Design Firm that has undertaken a contract of services for the services named, and is signed by a person authorised by that firm to verify the processes within the firm and competence of its designers.

A competent design professional will have a professional qualification and proven current competence through registration on a national competence based register, either as a Chartered Professional Engineer (CPEng) or a Registered Architect.

Membership of a professional body, such as Engineering New Zealand (formerly IPENZ), provides additional assurance of the designer's standing within the profession. If the design firm is a member of the ACE New Zealand, this provides additional assurance about the standing of the firm.

Persons or firms meeting these criteria satisfy the term "suitably qualified independent design professional".

*Professional Indemnity Insurance

As part of membership requirements, ACE New Zealand requires all member firms to hold Professional Indemnity Insurance to a minimum level.

The PI Insurance minimum stated on the front of this form reflects standard, small projects. If the parties deem this inappropriate for large projects the minimum may be up to $500,000.

Professional Services during Construction Phase

There are several levels of service which a Design Firm may provide during the construction phase of a project (CM1-CM5 for Engineers[3]). The Building Consent Authority is encouraged to require that the service to be provided by the Design Firm is appropriate for the project concerned.

Requirement to provide Producer Statement PS4

Building Consent Authorities should ensure that the applicant is aware of any requirement for producer statements for the construction phase of building work at the time the building consent is issued as no design professional should be expected to provide a producer statement unless such a requirement forms part of the Design firm's engagement.

Attached Particulars

Attached particulars referred to in this producer statement refer to supplementary information appended to the producer statement.

CMW Geosciences

CLIENT: WHF PROPERTIES LTD		DRAWN: CZ	PROJECT No: AKL2020-0082
PROJECT: BARTLETT BLOCK MILLWATER		CHECKED: SC	DRAWING: DG01(AG)
		REVISION: 0	SCALE: N.T.S.
TITLE: RETAINING WALL CASE PLAN		DATE: 22/04/2021	SHEET: A3

C:\USERS\CHAUDHARYZOHAIB\CMW GEOSCIENCES PTY LTD\CMW CONNECT - AKL2020-0082 BARTLETT BLOCK, MILLWATER\DRAWINGS\RETAINING WALL DESIGN DRAWINGS\REV - 0\AKL2020-0082 01 03 AG REV-0.DWG

NOTES

THIS DRAWING IS TO BE READ IN CONJUNCTION WITH THE RETAINING WALL DESIGN REPORT REFERENCE: AKL2020-0082AG REV 0.

SPECIFICATION

1. MATERIAL PROPERTIES

CONCRETE:	CHARACTERISTIC COMPRESSIVE STRENGTH F'C = 17.5 MPa UNLESS OTHERWISE NOTED.
TIMBER POLES:	H5 TREATED RADIATA PINE, HIGH DENSITY IN ACCORDANCE WITH NZS 3603 UNLESS OTHERWISE SPECIFIED.
TIMBER RAILINGS:	H4 TREATED RADIATA PINE
RAILING FIXINGS:	GALVANISED NAILS
DRAIN COIL:	110mm DIAMETER
DRAINAGE AGGREGATE:	APPROVED DRAINAGE-GRADED AGGREGATE OR SCORIA (USE OF COMPOSITE DRAINAGE PRODUCTS OR POLYSTYRENE NOT APPROVED)

2. FOR LOCATION AND EXTENT OF TIMBER POLE WALLS REFER TO PROJECT ENGINEERING DRAWINGS. SET OUT LOCATIONS TO BE PROVIDED BY OTHERS PRIOR TO THE COMMENCEMENT OF CONSTRUCTION.
3. MINIMUM CONCRETE COVER TO TIMBER POLES IS 50mm WITH A MINIMUM COVER OF 100mm AT THE PILE BASE. THIS WILL REQUIRE EITHER A PACKER OR POURING OF A PUNCH PAD TO ACHIEVE DESIGN. POLE HOLE DIAMETER MAY ONLY BE VARIED BY DESIGNER IN WRITING.
4. RAILS SHOULD BE CONTINUOUS OVER 3 SPANS WITH STAGGERED JOINTS. CUTTING OF TIMBERS SHALL BE AVOIDED WHEREVER POSSIBLE. TONGUE AND GROOVE BOARDS ARE NOT TO BE USED FOR RAILS. USE A NAIL WIDTH GAP BETWEEN RAILS.
5. IF CUTTING OF POLES OR RAILS IS NECESSARY THE EXPOSED SURFACES SHALL BE FLOODED WITH A COPPER NAPTHENATE TYPE WOOD PRESERVATIVE.
6. THE MAXIMUM RETAINING HEIGHT, TOE SLOPE AND SURCHARGE SLOPE SHALL BE AS SPECIFIED ON THE DESIGN AND SHALL NOT BE EXCEEDED UNLESS APPROVED BY THE DESIGN ENGINEER IN WRITING.
7. THE EXTENT OF EXCAVATION REQUIRED SHALL BE MARKED OUT ON THE GROUND HAVING REGARD TO THE POSITIONS OF POLES, WORKING SPACE FOR CONSTRUCTION, BACKFILL AND DRAINAGE PROVISIONS.
8. ALL PILE HOLES TO BE AUGERED AND DRILLING SPOIL DISPOSED OF AWAY FROM THE RETAINING WALL.
9. A PERFORATED SUBSOIL DRAIN WITHOUT FILTER SOCK SHALL BE LAID AND SURROUNDED IN APPROVED DRAINAGE-GRADED AGGREGATE OR SCORIA WITH INVERT 100mm BELOW DESIGN TOE SUBGRADE LEVELS CONNECTED TO A FREE OUTLET AT A POINT OF SAFE DISCHARGE OR CONNECTED TO STORMWATER SYSTEM.
10. THE CONTRACTOR SHALL REFER TO THE DESIGN ENGINEER AS SOON AS POSSIBLE FOR FURTHER INSTRUCTION SHOULD ANY UNFORESEEN CIRCUMSTANCE OR ABNORMAL SITE CONDITION BE ENCOUNTERED DURING CONSTRUCTION.
11. WHERE EXCAVATIONS ARE UNDERTAKEN MORE THAN A FEW DAYS IN ADVANCE OF WALL CONSTRUCTION, THE CUT FACE MUST BE COVERED WITH POLYTHENE TO PREVENT IT DRYING OUT AND CRACKING, ESPECIALLY WHERE EXPANSIVE CLAY SOILS ARE PRESENT. SIMILARLY DURING PERIODS OF WET WEATHER THE EXCAVATION FACE SHOULD BE PROTECTED WITH POLYTHENE AND SURFACE WATER DIRECTED AWAY FROM THE CREST AND TOE OF THE EXCAVATION.
12. CONTRACTOR IS RESPONSIBLE FOR ENSURING EXCAVATIONS ARE STAGED SO THAT EXCAVATED FACES ARE NOT LEFT UNSUPPORTED FOR ANY SIGNIFICANT LENGTH OF TIME. THIS IS ESPECIALLY CRITICAL FOR BOUNDARY CUT FACES.

INSPECTION HOLD POINTS:

1. GROUND CONDITIONS & DIMENSIONS IN PILE HOLES - PRIOR TO INSERTING POLES.
2. MEASUREMENT OF TIMBER POLE AND RAIL SIZES AND CONFIRMATION OF TREATMENT.
3. DRAINCOIL PLACEMENT - PRIOR TO RAILING UP.
4. DRAINAGE AGGREGATE QUALITY AND RAILING - PRIOR TO BACKFILL WITH DRAINAGE AGGREGATE.
5. FINAL INSPECTION AND DRAINAGE CONNECTIONS.
